CleverBin

NEW ERA OF THE KANBAN METHOD

The smart CleverBin (small parts bin) will revolutionize the management of C parts and enable truly Lean production. Thanks to new technology, it is flexible, proactive and not tied to a certain location. You only need one bin, which you can keep next to you when working, for example. The sensor of the bin will notice the decreasing of fasteners or other small components and will automatically form an order – well before you run out of parts. The Ferrometal shelving service delivers the replacement batch, ensuring in this way that the production operates without interruption.

CLEVERBIN BENEFITS

Quick & predictive

More precise production

Efficient operations

Transparent process

Lower storage values

Fewer mistakes

The size and number of small parts bins is optimised according to the needs of the production process.

The reader sensor monitors the surface height of the products in the bins. Once the ordering point has been reached, the system places an automatic order.

The movable front wall makes use easier and enables close shelf spacing – saving space.

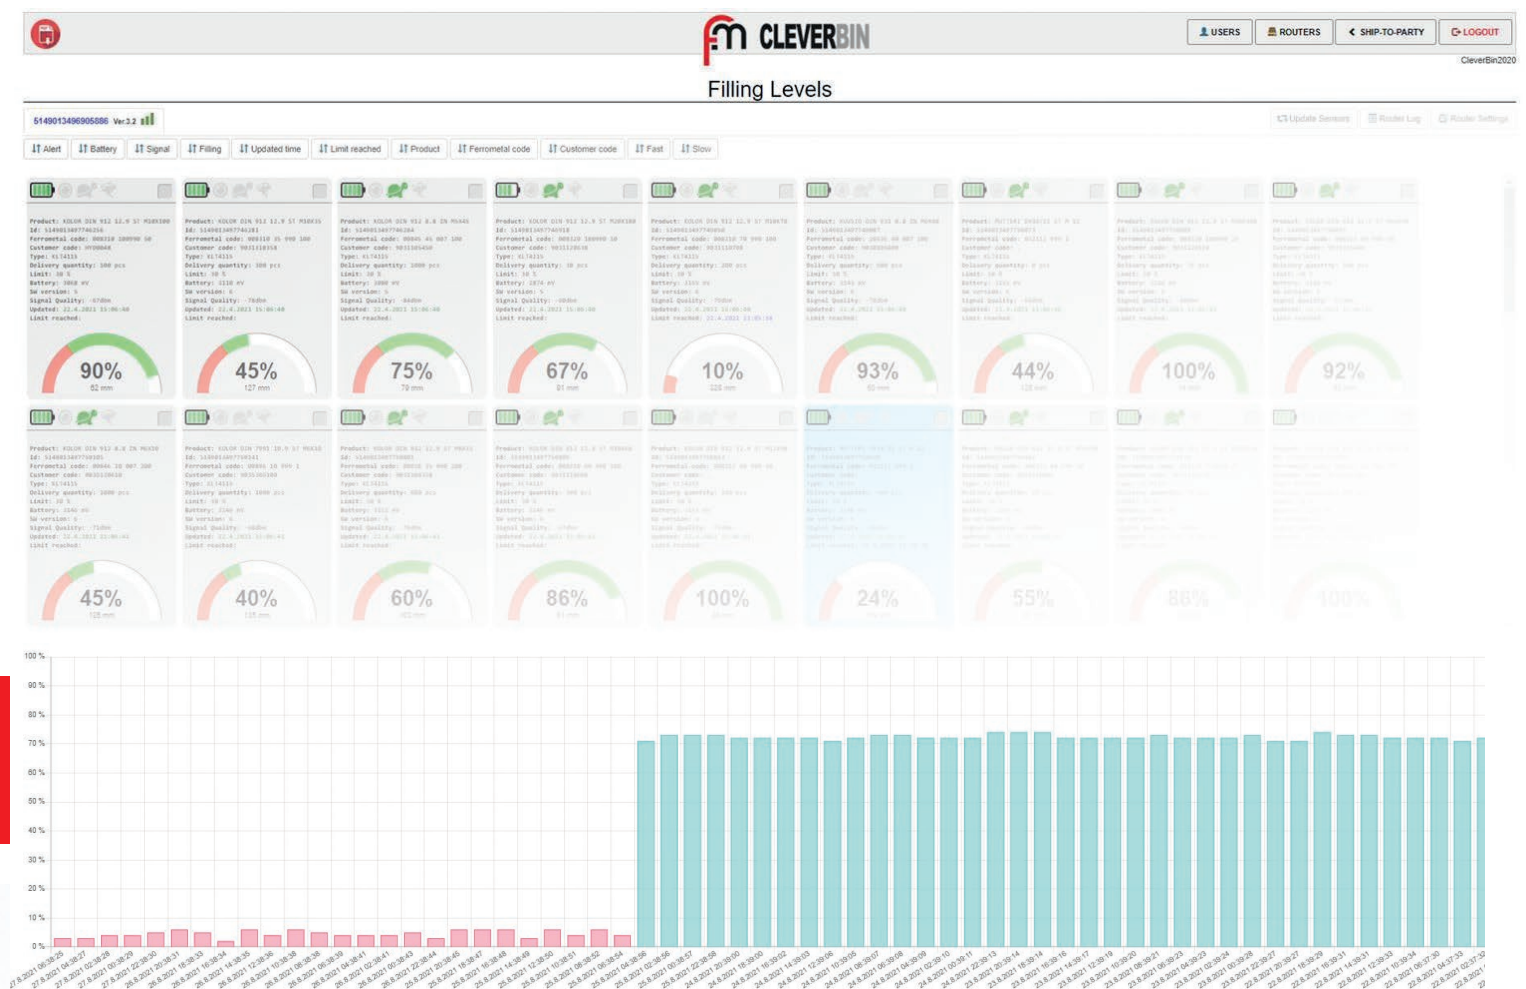

The sturdy structure ensures long useful life, even in extensive use.

How does CleverBin work?
